Firewall configuration requirements

Please contact your System Administrator and provide the following information:

Port type	: TCP
Port number	: 15000
Direction	: outgoing
External IP Address	: [not necessary] 204.200.27.56
Internal IP Address	: <if possible, do not specify>

Some firewall policy requires both an internal and an external IP address. If possible, Wycom suggests that the internal IP address not be specified. This will allow you to change the internal IP address of the WYCOM UNIT without requiring a change in the firewall rule.

The IP address 204.200.27.56 is the IP address of our update server, and is the default IP address for both wycom connect and wycom update. If the firewall rule does not require that you specify this address, then you can safely ignore this address.

The port should be opened "outgoing" only. This will prevent outside machines from initiating communications with devices inside your network.
